What's new in Windows 10 for developers, build 14393

Article • 10/20/2022

Windows 10 build 14939 (also known as the Anniversary Update or version 1607), in combination with Visual Studio 2019 and the updated SDK, provide the tools, features, and experiences to make remarkable Universal Windows Platform apps. [Install the tools and SDK](#) on Windows 10 and you're ready to either [create a new Universal Windows app](#) or explore how you can use your [existing app code on Windows](#).

This is a list of new and improved features of interest to developers. For a raw list of new namespaces added to the Windows SDK, see the [Windows 10 build 14393 API changes](#). For more information on the highlighted features of this update, see [What's cool in Windows 10](#).

Windows 10 build 14393 - July 2016

Feature	Description
Access keys for XAML elements	You can use the new AccessKey property and the AccessKeyManager to improve keyboard accessibility in your app.
Animated GIF support	The XAML Image element now supports animated GIFs. You can use these new members on BitmapImage to control playback: AutoPlay , IsAnimatedBitmap , IsPlaying , Play , Stop .
App extensibility	Write extensions ↗ for your UWP apps. Enable your UWP app to host content provided by other UWP apps. Discover, enumerate, and access read-only content from those apps.
Assessment testing	Take a Test is a browser based app that renders locked down online assessments for high-stakes testing. Use the Take a Test APIs to prevent students from using other computer or Internet resources during a test.

Feature	Description
Background Intelligent Transfer Service (BITS)	It is now possible to use the BITS COM APIs and PowerShell cmdlets (where available) in a PowerShell Remote Session. This is especially useful when administrating versions of Windows Server 2016 Technical Preview that have no local login capability. BITS jobs started via PowerShell Remote Sessions run in the session's user account context, and will only make progress when there is at least on active local logon session or PowerShell Remote session associated with that user account. See To manage PowerShell Remote sessions for details on how to manage sessions for long-running transfers. In previous versions of Windows that supported BITS helper tokens, the job owner effectively had to have administrator privileges in order to set a helper token. In this release, it is now possible for a BITS job owner to set helper tokens without being an administrator, as long as the helper token does not have administrator capabilities. This reduces the vulnerability footprint of background download or update tools by enabling them to run under the lower-privileged NetworkService account rather than under an account with administrative privileges.
Improved support for color fonts	Direct2D now supports rendering a wider variety of color font formats, allowing developers to use more types of fonts in their Direct2D-powered apps than ever before. This includes support for: • 'sbix' OpenType table, which enables color bitmap content in fonts. • 'SVG ' OpenType table, which enables SVG content in fonts. • 'CBDT' OpenType table, which enables color bitmap content in fonts. Direct2D supports these color font formats automatically when the D2D1_DRAW_TEXT_OPTIONS_ENABLE_COLOR_FONT flag is enabled. For more information, see the following topics: • ID2D1DeviceContext4 • D2D1_DRAW_TEXT_OPTIONS • ID2D1SvgGlyphStyle
CommandBar dynamic overflow	Primary commands in a Commandbar will now automatically move to the overflow menu when there's not enough space to show them all.
Composition interactions API	The new Windows.UI.Composition.Interactions namespace allows you to access input to drive animations and effects. This new API family in the Visual Layer will help your app feel responsive and smooth even when your UI thread is bogged down and busy.
